Tagging jets in HF at L1

- ☐ size of HF jet window and pile-up jet rejection v.s. efficiency
- ☐ L1 jet shape information and pile-up jet rejection v.s. efficiency

L1 HF Jet Window

Present scheme :

HF L1 Jet Window is
3x3 HF trigger towers

HF trigger tower is 3x2
HF readout towers

*What is optimal Jet
Window size to trigger
on tagging jets in HF ?*

Size of HF Jet Window and pile-up jet rejection v.s. efficiency

Jet Window is 3x3 trigger towers. Size of the trigger tower is varied

size of HF trigger tower $N_\eta \times N_\phi$ off line HF towers	Jet Window size, $\Delta\eta \times \Delta\phi$
1 x 1	0.525 x 0.525
2 x 2	1.050 x 1.050
3 x 2	1.575 x 1.050

- ❑ 1 x 1 is the best
- ❑ 2 x 2 & 3 x 2 are very similar

Threshold for suppression 100

18 GeV for 1x1

25 GeV for 2x2

28 GeV for 3x2

L1 jet shape information and pile-up jet rejection v.s. efficiency (I)

cutoff on central trigger tower after suppression ~ 100
with threshold on Jet window E_T

there is no
difference

L1 jet shape information and pile-up jet rejection v.s. efficiency (II)

cutoff on highest E_T tower inside central trigger tower
after suppression ~ 100 with threshold on Jet window E_T

there is no
difference

Do we need shape variable ?

solid line contour -
 $\epsilon(\text{pile-up}) = 100$

dashed line contour -
 $\epsilon(\text{pile-up}) = 500$

numbers -

$\epsilon(\text{tag.jet})$ for
 $\epsilon(\text{pile-up}) = 100$

combined cut on E_T
of central tower and
jet window is
more effective
